M

Media Object

The media object in Bootstrap helps to position media (such as images or video) alongside other content (such as text) that does not wrap around the media. To create a media object in Bootstrap, you must use these two classes: **media** and **media-body**, typically with div elements.

N

Navbar

A navbar is usually a horizontal bar across a webpage with links to access different parts of the website (though it can also be vertical). Bootstrap offers a **Navbar** component that is easy to implement and can be made responsive. There is no HTML <navbar> element, but there is an HTML element called <nav> that is typically used with the Bootstrap Navbar component.

T

Table

The **<table>** element is a part of HTML. In the early days of web development, tables were very often used for page layout purposes. In modern web development, this is considered bad practice, as CSS is used for layout these days. Tables should now be used for their original purpose: displaying tabular data. The Bootstrap **Table** component offers numerous classes to help easily style tables, including table-header, table-striped, table-hover, and many more.
